54F/74F402 Serial Data Polynomial Generator/Checker

General Description

The ’F402 expandable Serial Data Polynomial generator/checker is an expandable version of the ’F401. It provides an advanced tool for the implementation of the most widely used error detection scheme in serial digital handling systems. A 4-bit control input selects one-of-six generator polynomials. The list of polynomials includes CRC-16, CRC-CCITT and Ethernet®, as well as three other standard polynomials (56^{th} order, 48^{th} order, 32^{nd} order). Individual clear and preset inputs are provided for floppy disk and other applications. The Error output indicates whether or not a transmission error has occurred. The CWG Control input inhibits feedback during check word transmission. The ’F402 is compatible with FAST® devices and with all TTL families.

Features

- Guaranteed 30 MHz data rate
- Six selectable polynomials
- Other polynomials available
- Separate preset and clear controls
- Expandable
- Automatic right justification
- Error output open collector
- Typical applications:
  Floppy and other disk storage systems
  Digital cassette and cartridge systems
  Data communication systems

Commercial	Military	Package Number	Package Description
74F402PC		N16E	16-Lead (0.300″ Wide) Molded Dual-In-Line
	54F402DM (Note 1)	J16A	16-Lead Ceramic Dual-In-Line
	54F402FM (Note 1)	W16A	16-Lead Cerpack
	54F402LM (Note 1)	E20A	20-Lead Ceramic Leadless Chip Carrier, Type C

Note 1: Military grade device with environmental and burn-in processing. Use suffix = DMQB, FMQB and LMQB.

Functional Description

The 'F402 Serial Data Polynomial Generator/Checker is an expandable 16-bit programmable device which operates on serial data streams and provides a means of detecting transmission errors. Cyclic encoding and decoding schemes for error detection are based on polynomial manipulation in modulo arithmetic. For encoding, the data stream (message polynomial) is divided by a selected polynomial. This division results in a remainder (or residue) which is appended to the message as check bits. For error checking, the bit stream containing both data and check bits is divided by the same selected polynomial. If there are no detectable errors, this division results in a zero remainder. Although it is possible to choose many generating polynomials of a given degree, standards exist that specify a small number of useful polynomials. The 'F402 implements the polynomials listed in Table I by applying the appropriate logic levels to the select pins S_0, S_1, S_2 and S_3.

The 'F402 consists of a 16-bit register, a Read Only Memory (ROM) and associated control circuitry as shown in the Block Diagram. The polynomial control code presented at inputs S_0, S_1, S_2 and S_3 is decoded by the ROM, selecting the desired polynomial or part of a polynomial by establishing shift mode operation on the register with Exclusive OR (XOR) gates at appropriate inputs. To generate the check bits, the data stream is entered via the Data Inputs (D), using the LOW-to-HIGH transition of the Clock Input (CP). This data is gated with the most significant Register Output (RO) via the Register Feedback Input (RFB), and controls the XOR gates. The Check Word Generate (CWG) must be held HIGH while the data is being entered. After the last data bit is entered, the CWG is brought LOW and the check bits are shifted out of the register(s) and appended to the data bits (no external gating is needed).

To check an incoming message for errors, both the data and check bits are entered through the D Input with the CWG Input held HIGH. The Error Output becomes valid after the last check bit has been entered into the 'F402 by a LOW-to-HIGH transition of CP, with the exception of the Ethernet polynomial (see Applications paragraph). If no detectable errors have occurred during the data transmission, the resultant internal register bits are all LOW and the Error Output ($\overline{ER}$) is HIGH. If a detectable error has occurred, $\overline{ER}$ is LOW. $\overline{ER}$ remains valid until the next LOW-to-HIGH transition of CP or until the device has been preset or reset.

A HIGH on the Master Reset Input (MR) asynchronously clears the entire register. A LOW on the Preset Input ($\overline{P}$) asynchronously sets the entire register with the exception of:

1 The Ethernet residue selection, in which the registers containing the non-zero residue are cleared;

2 The 56th order polynomial, in which the 8 least significant register bits of the least significant device are cleared; and,

3 Register S = 0, in which all bits are cleared.

Applications

In addition to polynomial selection there are four other capabilities provided for in the 'F402 ROM. The first is set or clear selectability. The sixteen internal registers have the capability to be either set or cleared when $\overline{P}$ is brought LOW. This set or clear capability is done in four groups of 4 (see Table II, P_0–P_3). The second ROM capability (C_0) is in determining the polarity of the check word. As is the case with the Ethernet polynomial the check word can be inverted when it is appended to the data stream or as is the case with the other polynomials, the residue is appended with no inversion. Thirdly, the ROM contains a bit (C_1) which is used to select the RFB input instead of the SEI input to be fed into the LSB. This is used when the polynomial selected is actually a residue (least significant) stored in the ROM which indicates whether the selected location is a polynomial or a residue. If the latter, then it inhibits the RFB input.

As mentioned previously, upon a successful data transmission, the CRC register has a zero residue. There is an exception to this, however, with respect to the Ethernet polynomial. This polynomial, upon a successful data transmission, has a non-zero residue in the CRC register (C7 04 DD $7B)_{16}$. In order to provide a no-error indication, two ROM locations have been preloaded with the residue so that by selecting these locations and clocking the device one additional time, after the last check bit has been entered, will result in zeroing the CRC register. In this manner a no-error indication is achieved.

With the present mix of polynomials, the largest is 56^{th} order requiring four devices while the smallest is 16^{th} order requiring just one device. In order to accommodate multiplexing between high order polynomials (X 16^{th} order) and lower order polynomials, a location of all zeros is provided. This allows the user to choose a lower order polynomial even if the system is configured for a higher order one.

The 'F402 expandable CRC generator checker contains 6 popular CRC polynomials, 2-16^{th} Order, 2-32^{nd} Order, 1-48^{th} Order and 1-56^{th} Order. The application diagram shows the 'F402 connected for a 56^{th} Order polynomial. Also shown are the input patterns for other polynomials. When the 'F402 is used with a gated clock, disabling the clock in a HIGH state will ensure no erroneous clocking occurs when the clock is re-enabled. Preset and Master Reset are asynchronous inputs presetting the register to S or clearing to 1s respectively (note Ethernet residue and 56^{th} Order select code 8, LSB, are exceptions to this).

To generate a CRC, the pattern for the selected polynomial is applied to the S inputs, the register is preset or cleared as required, clock is enabled, CWG is set HIGH, data is applied to D input, output data is on D/CW. When the last data bit has been entered, CWG is set LOW and the register is clocked for n bits (where n is the order of the polynomial). The clock may now be stopped if desired (holding CWG LOW and clocking the register will output zeros from D/CW after the residue has been shifted out).

To check a CRC, the pattern for the selected polynomial is applied to the S inputs, the register is preset or cleared as required, clock is enabled, CWG is set HIGH, the data stream including the CRC is applied to D input. When the last bit of the CRC has been entered, the $\overline{ER}$ output is checked: HIGH = error free data, LOW = corrupt data. The clock may now be stopped if desired.

To implement polynomials of lower order than 56^{th}, select the number of packages required for the order of polynomial and apply the pattern for the selected polynomial to the S inputs (0000 on S inputs disables the package from the feedback chain).

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Storage Temperature	−65°C to +150°C
Ambient Temperature under Bias	−55°C to +125°C
Junction Temperature under Bias	−55°C to +175°C
Plastic	−55°C to +150°C
V_{CC} Pin Potential to Ground Pin	−0.5V to +7.0V
Input Voltage (Note 2)	−0.5V to +7.0V
Input Current (Note 2)	−30 mA to +5.0 mA
Voltage Applied to Output in HIGH State (with V_{CC} = 0V)	
Standard Output	−0.5V to V_{CC}
TRI-STATE® Output	−0.5V to +5.5V
Current Applied to Output in LOW State (Max)	twice the rated I_{OL} (mA)

Note 1: Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Either voltage limit or current limit is sufficient to protect inputs.

Recommended Operating Conditions

Free Air Ambient Temperature	
Military	−55°C to +125°C
Commercial	0°C to +70°C
Supply Voltage	
Military	+4.5V to +5.5V
Commercial	+4.5V to +5.5V

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
