

54FCT/74FCT533A

Octal Transparent Latch with TRI-STATE® Outputs

General Description

The 'FCT533A consists of eight latches with TRI-STATE outputs for bus organized system applications. The flip-flops appear transparent to the data when Latch Enable (LE) is HIGH. When LE is LOW, the data that meets the setup times is latched. Data appears on the bus when the Output Enable (\overline{OE}) is LOW. When \overline{OE} is HIGH the bus output is in the high impedance state. The 'FCT533A is the same as the 'FCT373A, except that the outputs are inverted.

FACT FCTA utilizes NSC quiet series technology to provide improved quiet output switching and dynamic threshold performance.

FACT FCTA features undershoot correction and split ground bus for superior performance.

Functional Description

The 'FCT533A contains eight D-type latches with TRI-STATE output buffers. When the Latch Enable (LE) input is HIGH, data on the D_n inputs enters the latches. In this condition the latches are transparent and the latch output will change state each time its D input changes. When LE is LOW, the latches store the information that was present on

the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The TRI-STATE buffers are controlled by the Output Enable (\overline{OE}) input. When \overline{OE} is LOW the latch contents are presented inverted at the outputs $\overline{O_7}$ - $\overline{O_0}$. When \overline{OE} is HIGH the buffers are in the high impedance mode but this does not interfere with entering new data into the latches.
