

74VHCT245A

Octal Buffer/Line Driver with 3-STATE Outputs

General Description

The VHCT245A is an advanced high speed CMOS octal bus transceiver fabricated with silicon gate CMOS technology. It achieves high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. The VHCT245A is intended for bidirectional asynchronous communication between data busses. The direction of data transmission is determined by the level of the T/R input. The enable input can be used to disable the device so that the busses are effectively isolated. Protection circuits ensure that 0V to 7V can be applied to the input and output (Note 1) pins without regard to the

supply voltage. These circuits prevent device destruction due to mismatched supply and input/output voltages. This device can be used to interface 5V to 3V systems and two supply systems such as battery back up.

Note 1: Outputs in OFF-State

Features

- High Speed: $t_{PD} = 5.4$ ns (typ) at $V_{CC} = 5$ V
- Power Down Protection on Inputs and Outputs
- Low Power Dissipation: $I_{CC} = 4$ μ A (Max) @ $T_A = 25^\circ$ C
- Pin and Function Compatible with 74HCT245

Note 2: Absolute Maximum Ratings are values beyond which the device may be damaged or have its useful life impaired. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation outside databook specifications.

Note 3: HIGH or LOW state. I_{OUT} absolute maximum rating must be observed.

Note 4: When outputs are in OFF-State or when $V_{CC} = 0V$.

Note 5: $V_{OUT} < GND$, $V_{OUT} > V_{CC}$ (Outputs Active).

Note 6: Unused inputs must be held HIGH or LOW. They may not float.
