LOGIC SYMBOL

V_{CC} = Pin 24
GND = Pin 12

FUNCTIONAL DESCRIPTION — The '11 decoder accepts four inputs and provides 16 mutually exclusive active LOW outputs, as shown by the logic symbol. The active LOW outputs facilitate addressing other MSI units with active LOW enable. The '11 can demultiplex data by routing it from one input to one of 16 possible decoder outputs. The desired output is addressed and the data is applied to one of the enable inputs. Providing that the other enable is LOW, the addressed output will follow the state of the applied data.
