CLC231 Fast Settling Wideband Buff-Amp

Literature Number: SNOS847

Comlinear CLC231 Fast Settling, Wideband Buff-Amp™ (A_v = ±1 to ±5)

General Description

The CLC231 Buff-Amp™ is a wideband operational amplifier **designed specifically for high-speed, low-gain applications**. The CLC231 is based on Comlinear's proprietary op amp topology—a unique design that both eliminates the gain-bandwidth tradeoff and permits unprecedented high-speed performance. (See table below.)

The CLC231 Buff-Amp™ is the **ideal design alternative to low-precision open-loop buffers and oscillation-prone conventional op amps**. The CLC231 offers precise gains from ±1.000 to ±5.000 and linearity that is a true .1%—even for demanding 50 ohm loads. Open-loop buffers, on the other hand, offer a nominal gain of .95 ± .03 and a linearity of only 3% for typical loads. A buffer's settling time may look impressive but it is usually specified at unrealistically large load resistances or when the effects of thermal tail are not included; the CLC231 Buff-Amp™ settles to .05% in 15ns—while driving a 100 ohm load.

Offsets and drifts, usually a low priority in conventional high-speed op amp designs, were not ignored in the CLC231; the input offset voltage is typically 1mV and **input offset voltage drift is only 10μV/°C**. The CLC231 is stable and oscillation-free across the entire gain range and since it's **internally compensated**, the user is saved the trouble of designing external compensation networks and having to "tweak" them in production. The absence of a gain-bandwidth tradeoff in the CLC231 allows performance to be predicted easily; the table below shows how the bandwidth is affected very little by changing the gain setting.

The CLC231 is constructed using thin film resistor/bipolar transistor technology, and is available in the following versions:

- CLC231AI -25°C to +85°C 12-pin TO-8 can
- CLC231A8C -55°C to +125°C 12-pin TO-8 can, MIL-STD-883, Level B
- CLC231AK -55°C to +125°C 12-pin TO-8 can, features burn-in and hermetic testing
- CLC231AM -55°C to +125°C 12-pin TO-8 can, screened to Comlinear's M standard for high reliability

DESC SMD number: 5962-89594

Typical Performance

parameter	gain setting						units
	1	2	5	-1	-2	-5	
-3dB bandwidth	180	165	130	165	150	115	MHz
rise time (2V)	1.8	2.0	2.5	2.0	2.2	2.9	ns
slew rate	2.5	3	3	3	3	3	V/ns
settling time (to .1%)	12	12	12	12	12	15	ns

Features

- 165MHz closed-loop -3dB bandwidth
- 15ns settling to 0.05%
- 1mV input offset voltage, 10μV/°C drift
- 100mA output current
- Excellent AC and DC linearity

Applications

- Driving flash A/D converters
- Precision line driving (a gain of 2 cancels matched-line losses)
- DAC current-to-voltage conversion
- Low-power, high-speed applications (50mW @ ±5V)

Small Signal Pulse Response

Bottom View

Pins 2 and 8 are used to adjust the supply current or to adjust the offset voltage (see text). These pins are normally left unconnected.

Package Dimensions

Min/max ratings are based on product characterization and simulation. Individual parameters are tested as noted. Outgoing quality levels are determined from tested parameters.

Absolute Maximum Ratings

Input and Common Mode Voltage Limits

supply voltage V_{cc}	±20V
output current	±100mA
thermal resistance (θ_{ca})	see thermal model
junction temperature	+175°C
operating temperature	AI: -25°C to +85°C A8/AK: -55°C to +125°C
storage temperature	-65°C to +150°C
lead temperature (soldering 10s)	+300°C

*note 1: Parameters preceded by an * are the final electrical test parameters and are 100% tested. A8 and AK units are tested at -55°C, +25°C, and +125°C. AI units are tested only at +25°C although performance at -25°C and +85°C is guaranteed to be better than or equal to the performance of A8 units over their temperature range.

note 2: The output amplitude used in testing is $0.63V_{pp}$. Performance is guaranteed for conditions listed.

note 3: In the non-inverting configuration, care should be taken when choosing R_i , the input impedance setting resistor; bias currents of typically $5\mu A$ but as high as $24\mu A$ can create an input signal large enough to cause overload. It is therefore recommended that $R_i < (V_{cc}/A_v)/24\mu A$.

note 4: These ratings protect against damage to the input stage caused by saturation of either the input or output stages at lower supply voltages, and against exceeding transistor collector-emitter breakdown ratings at high supply voltages. $V_{out}(max)$ is calculated by assuming no output saturation. Saturation is allowed to occur up to this calculated level of V_{out} . V_{cm} is defined as the voltage at the non-inverting input, pin 6.

CLC231 Typical Performance Characteristics ($T_A = 25^\circ$, $A_v = +2$, $V_{CC} = \pm 15V$, $R_L = 100\Omega$; unless specified)

Thermal Model

$P_{circuit} = I_{CC} [(+V_{CC}) - (-V_{CC})]$ where $I_{CC} = 16mA$ at $\pm 15V$
 $P_{xxx} = [(\pm V_{CC}) - V_{out} - (I_{col})(R_{col} + 4)] (I_{col})$ (% duty cycle)
 (For positive V_O and V_{CC} , this is the power in the npn output stage.)
 (For negative V_O and V_{CC} , this is the power in the pnp output stage.)

$I_{col} = V_{out}/R_{load}$ or $4mA$, whichever is greater. (Include feedback R in R_{load} .)
 R_{col} is a resistor (33Ω recommended) between the xxx collector and $\pm V_{CC}$.
 $T_j (pnp) = P_{pnp} (100 + \theta_{ca}) + (P_{cir} + P_{npn}) \theta_{ca} + T_a$, similar for $T_j (nnp)$.
 $T_j (cir) = P_{cir} (48 + \theta_{ca}) + (P_{pnp} + P_{npn}) \theta_{ca} + T_a$.

CLC231 Operation

The CLC231 Buff-Amp™ is based on Comlinear's proprietary op amp topology, a design that uses current feedback instead of the usual voltage feedback. A complete discussion of current feedback is given in application note AN300-1.

The use of the CLC231 is basically the same as that of the conventional op amp (see the gain equations above). Since the device is designed specifically for low gain applications, the best performance is obtained when the circuit is used at gains between ± 1 and ± 5 . Additionally, performance is optimum when a 250Ω feedback resistor is used.

Layout Considerations

To assure optimum performance the user should follow good layout practices which minimize the unwanted coupling of signals between nodes. During initial breadboarding of the circuit, use direct point to point wiring, keeping the lead lengths to less than .25". The use of solid, unbroken ground plane is helpful. Avoid wire-wrap type pc boards and methods. Sockets with small, short pin receptacles may be used with minimal performance degradation although their use is not recommended.

During pc board layout, keep all traces short and direct. The resistive body of R_g should be as close as possible to pin 5 to minimize capacitance at that point. For the same reason, remove ground plane from the vicinity of pins 5 and 6. In other areas, use as much ground plane as possible on one side of the board. It is especially important to provide a ground return path for current from the load resistor to the power supply bypass capacitors. Ceramic capacitors of .01 to .1μF (with short leads) should be less than .15 inches from pins 1 and 9. Larger tantalum capacitors should be placed within one inch of these pins. V_{cc} connections to pins 10 and 12 can be made directly from pins 9 and 1, but better supply rejection and settling time are obtained if they are separately bypassed as in figures 1 and 2. To prevent signal distortion caused by reflections from impedance mismatches, use terminated microstrip or coaxial cable when the signal must traverse more than a few inches.

Since the pc board forms such an important part of the circuit, much time can be saved if prototype boards of any high frequency sections are built and tested early in the design phase. Evaluation boards designed for either inverting or non-inverting gains are available from Comlinear at minimal cost.

Thermal Considerations

At high ambient temperatures or large internal power dissipations, heat sinking is required to maintain acceptable junction temperatures. Use the thermal model on the previous page to determine junction temperatures. Many styles of heat sinks are available for TO-8 packages; the Thermalloy 2240 and 2268 are good examples. Some heat sinks are the radial fin type which cover the pc board and may interfere with external components. An excellent solution to this problem is to use surface mounted resistors and capacitors. They have a very low profile and actually improve high frequency performance. For use of these

heat sinks with conventional components, a .1" high spacer can be inserted under the TO-8 package to allow sufficient clearance.

Low V_{cc} Operation: Supply Current Adjustment

The CLC231 is designed to operate on supplies as low as $\pm 5V$. In order to improve full bandwidth at reduced supply voltages, the supply current (I_{cc}) must be increased. The plot of Bandwidth vs V_{cc} shows the effect of shorting pins 1 and 2 and pins 8 and 9; this will increase both bandwidth and supply current. Care should be taken to not exceed the maximum junction temperatures; for this reason this technique should not be used with supplies exceeding $\pm 10V$. For intermediate values of V_{cc} , external resistors between pins 1 and 2 and pins 8 and 9 can be used.

Offset Voltage Adjustment

If trimming of the input offset voltage ($V_{os} = V_{ni} - V_{in}$) is desired, a resistor value of 10kΩ to 1MΩ placed between pins 8 and 9 will cause V_{os} to become more negative by 8mV to 0.2mV respectively. Similarly, a resistor placed between pins 1 and 2 will cause V_{os} to become more positive.

Distortion and Noise

The graphs of intercept point, I_2 and I_3 , versus frequency on the preceding page make it easy to predict the distortion at any frequency given the output voltage of the CLC231. First, convert the output voltage (V_o) to $V_{RMS} = (V_{pp}/2\sqrt{2})$ and then to $P = [(10\log_{10}(20V_{RMS}^2))]$ to get the power output in dBm. At the frequency of interest, its 2nd harmonic will be $S_2 = (I_2 - P)$ dB below the level of P. Its third harmonic will be $S_3 = 2(I_3 - P)$ dB below P, as will the two-tone third order intermodulation products. These approximations are useful for $P < -1$ dB compression levels.

Approximate noise figure can be determined for the CLC231 using the equivalent input noise graph on the preceding page. The following equation can be used to determine noise figure (F) in dB.

$$F = 10\log \left[1 + \frac{i_n^2 R_f^2}{v_n^2 + A_v^2} \right]$$

Where v_n is the rms noise voltage and i_n is the rms noise current. Beyond the breakpoint of the curves (i.e., where they are flat), broadband noise figure equals spot noise figure, so Δf should equal one (1) and v_n and i_n should be read directly off the graph. Below the breakpoint, the noise must be integrated and Δf set to the appropriate bandwidth.

Application Notes and Assistance

Application notes that address topics such as data conversion, fiber optics, and general high frequency circuit design are available from Comlinear or your Comlinear sales engineer.

Comlinear maintains a staff of highly qualified applications engineers to provide technical and design assistance.

Customer Design Applications Support

National Semiconductor is committed to design excellence. For sales, literature and technical support, call the National Semiconductor Customer Response Group at **1-800-272-9959** or fax **1-800-737-7018**.

Life Support Policy

National's products are not authorized for use as critical components in life support devices or systems without the express written approval of the president of National Semiconductor Corporation. As used herein:

1. Life support devices or systems are devices or systems which, a) are intended for surgical implant into the body, or b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
