

Programmable Spread Spectrum Clock Generator for EMI Reduction

Features

- Wide Operating Output (SSCLK) Frequency Range
 - 3 to 200 MHz
- Programmable Spread Spectrum with Nominal 31.5 kHz modulation Frequency
- Center Spread: $\pm 0.25\%$ to $\pm 2.5\%$
- Down Spread: -0.5% to -5.0%
- Input Frequency Range
 - External crystal: 8 to 30 MHz fundamental crystals
 - External reference: 8 to 166 MHz clock
- Integrated Phase-Locked Loop (PLL)
- Programmable Crystal Load Capacitor Tuning Array
- Low Cycle-to-Cycle Jitter
- 3.3 V Operation with 2.5 V Output Clock Drive Option
- Spread Spectrum On and Off Function
- Power Down or Output Enable Function
- Output Frequency Select Option
- Field-Programmable
- Package: 16 Pin TSSOP

Description

The CY25200 is a programmable clock generator with spread spectrum capability. Spread spectrum modulates the output clock frequency over a small range, spreading the energy and reducing the energy peak. This is a powerful technique to reduce EMI in a variety of applications.

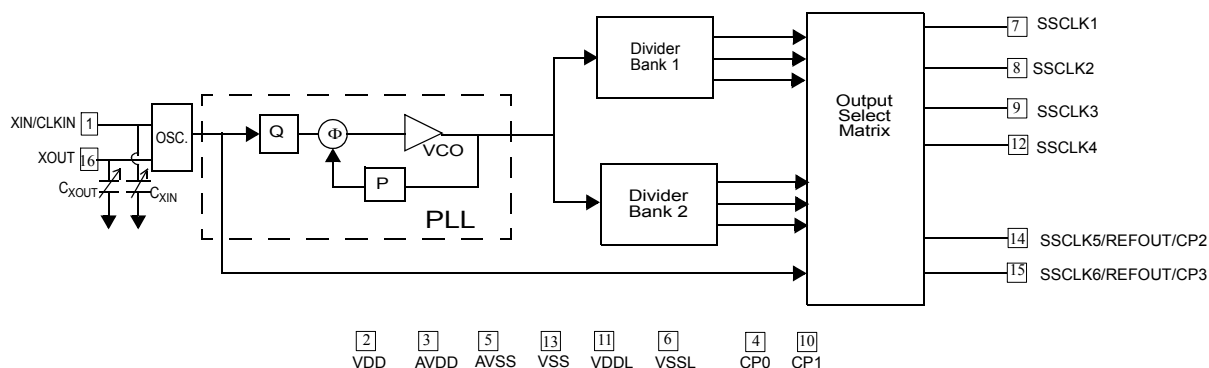

It uses either an external reference clock or a crystal for an input. It also uses a PLL to generate a spread spectrum output clock that can be a different frequency than the input. Up to six output clocks are available and up to two of them can be REFCLKs (copies of the input clock, without spread).

The CY25200 is highly configurable. Programmable variables include the input and output frequencies, spread percentage, center spread or down spread, and control pin functions. The oscillator pin capacitance can also be programmed to match the load capacitance requirement (C_L) of the crystal, eliminating the need for external capacitors.

Available features include Output Enable, Power Down, Spread On/Off, Frequency Select, and the option to power some output clocks at 2.5 V.

Cypress' web-based CyberClocks Online software is used to configure the device. Programmability enables fast prototyping, which is particularly useful when doing EMC testing and determining the optimal spread settings.

Pin Configuration

Figure 1. Pin Diagram

General Description

The CY25200 is a Spread Spectrum Clock Generator (SSCG) IC used to reduce Electro Magnetic Interference (EMI) found in today's high speed digital electronic systems.

The device uses a Cypress proprietary Phase-Locked Loop (PLL) and Spread Spectrum Clock (SSC) technology to synthesize and modulate the frequency of the input clock. By frequency modulating the clock, the measured EMI at the fundamental and harmonic frequencies are reduced. This reduction in radiated energy significantly reduces the cost of complying with regulatory agency requirements (EMC) and improves time to market, without degrading system performance.

The CY25200 uses a factory and field-programmable configuration memory array to synthesize output frequency,

spread %, crystal load capacitor, clock control pins, PD#, and OE options.

The spread % is factory and field-programmed to either center spread or down spread with various spread percentages. The range for center spread is from $\pm 0.25\%$ to $\pm 2.50\%$. The range for down spread is from -0.5% to -5.0% . Contact the factory for smaller or larger spread % amounts, if required.

The input to the CY25200 is either a crystal or a clock signal. The input frequency range for crystals is 8 to 30 MHz and for clock signals is 8 to 166 MHz.

The CY25200 has six clock outputs, SSCLK1 to SSCLK6. The frequency modulated SSCLK outputs are programmed from 3 to 200 MHz.

The CY25200 products are available in a 16-pin TSSOP package with a commercial operating temperature range of 0 to 70 °C.

Table 1. Pin Summary

Name	Pin Number	Description
XIN	1	Crystal input or Reference Clock input
XOUT	16	Crystal output. Leave this pin floating if external clock is used
VDD	2	3.3 V power supply for digital logic and SSCLK5 and 6 clock outputs
AVDD	3	3.3 V analog-PLL power supply
VSS	13	Ground
AVSS	5	Analog ground
VDDL	11	2.5 V or 3.3 V power supply for SSCLK1/2/3/4 clock outputs
VSSL	6	VDDL power supply ground
SSCLK1	7	Programmable spread spectrum clock output at VDDL level (2.5 V or 3.3 V)
SSCLK2	8	Programmable spread spectrum clock output at VDDL level (2.5 V or 3.3 V)
SSCLK3	9	Programmable spread spectrum clock output at VDDL level (2.5 V or 3.3 V)
SSCLK4	12	Programmable spread spectrum clock output at VDDL level (2.5 V or 3.3 V)
SSCLK5/REFOUT/CP2	14	Programmable spread spectrum clock or buffered reference output at VDD level (3.3 V) or control pin, CP2
SSCLK6/REFOUT/CP3	15	Programmable spread spectrum clock or buffered reference output at VDD level (3.3 V) or control pin, CP3
CP0 ^[1]	4	Control pin 0
CP1 ^[1]	10	Control pin 1

Note

1. Pins are programmed to be any of the following control signals: OE: Output Enable, OE = 1, all the SSCLK outputs are enabled; PD#: Power down, PD# = 0, all the SSCLK outputs are three-stated and the part enters a low power state; SSON: Spread Spectrum Control (SSON = 0, No Spread and SSON = 1, Spread Signal), CLKSEL: SSCLK Output Frequency Select. See [Control Pins \(CP0, CP1, CP2 and CP3\)](#) for control pins programming options.

Programming Description

Field-Programmable CY25200

The CY25200 is programmed at the package level, and must be programmed prior to installation on a circuit board. Field programmable devices are denoted by an “F” in the ordering code, and are blank when shipped. The CY25200 is Flash technology based, which allows it to be reprogrammed up to 100 times. This allows for fast and easy design changes and product updates, and eliminates issues with old and out of date inventory.

Samples and small prototype quantities are programmed on the CY3672 programmer with the CY3695 socket adapter.

CyberClocks™ Online Software

CyberClocks™ Online Software is a web based software application that allows the user to custom configure the CY25200. All the parameters in [Table 2](#) and [Table 3](#) are entered as variables into the software. CyberClocks Online outputs an

industry standard JEDEC file used for programming the CY25200. CyberClocks Online is available at www.cyberclocksonline.com website.

Factory-Programmed CY25200

Factory programming by Cypress is available for high volume orders. All requests must be submitted to the local Cypress Field Application Engineer (FAE) or sales representative. After the request is processed, you will receive a new part number, samples, and data sheet with the programmed values. This part number is used for additional sample requests and production orders.

Product Functions

Control Pins (CP0, CP1, CP2 and CP3)

Four control signals are available through programming of pins 4, 10, 14, and 15.

CP0 (pin 4) and CP1 (pin10) are specifically designed to function as control pins. However, pins 14 (SSCLK5/REFOUT/CP2) and 15 (SSCLK6/REFOUT/CP3) are multi-functional and can be programmed to be either a control signal or an output clock (SSCLK or REFOUT). All of the control pins, CP0, CP1, CP2, and CP3 are programmable to one of the following functions:

- OE (Output Enable): if OE = 1, all SSCLK and REFOUT outputs are enabled.
- SSON (Spread spectrum control): if SSON = 1, spread is on; if SSON = 0, spread is off.
- CLKSEL (Clock select): frequency select for all SSCLK outputs.
- PD# (Power Down; active low): if PD# = 0, all the outputs are three-stated and the part enters a low power state.

Note that the PD# function is available only on CP0 or CP1; it is not available on CP2 or CP3.

Example

Here is an example with three control pins:

- CLKIN = 33 MHz
- SSCLK1/2/3/4 = 100 MHz with ±1% spread
- SSCLK 5 = REFOUT(33 MHz)
- CP0 (pin 4) = PD#
- CP1 (pin 10) = OE
- CP3 (pin 15) = SSON

The pinout for the above example is shown in [Figure 2](#).

Figure 2. Example Pin Diagram

CLKSEL

The CLKSEL control pin enables you to select between two different SSCLK output frequencies. These must be related frequencies that are derived off of a common PLL frequency. Specifically, CLKSEL does not change the PLL frequency. It only changes the output divider. For instance, 33.333 MHz and 66.666 MHz are both derived from a PLL frequency of 400 MHz, by dividing it down by 12 and 6 respectively. [Table 4 on page 6](#) shows an example of how this is implemented. The PLL frequency range is 100 to 400 MHz. The two output dividers in the CY25200 can be any integer between 2 and 130, providing two different but related frequencies as explained above.

[Table 4 on page 6](#) and [Figure 3 on page 6](#) show an example configuration using the frequencies just described. In this example, the configurable pins SSCLK5 (pin 14) and SSCLK6 (pin 15) are used as output clocks.

Input Frequency (XIN, Pin 1 and XOUT, Pin 16)

The input to the CY25200 is a crystal or a clock. The input frequency range for crystals is 8 to 30 MHz, and for clock signal is 8 to 166 MHz.

C_{XIN} and C_{XOUT} (Pin 1 and Pin 16)

The CY25200 has internal load capacitors at pin 1 (C_{XIN}) and pin 16 (C_{XOUT}). C_{XIN} always equals C_{XOUT}, and they are programmable from 12 pF to 60 pF, in 0.5 pF increments. This feature eliminates the need for external crystal load capacitors.

The following formula is used to calculate the value of C_{XIN} and C_{XOUT} for matching the crystal load (C_L):

$$C_{XIN} = C_{XOUT} = 2C_L - C_P$$

Where C_L is the crystal load capacitor as specified by the crystal manufacturer and C_P is the parasitic PCB capacitance on each node of the crystal.

For example, if a crystal with C_L of 16 pF is used, and C_P is 2 pF, C_{XIN} and C_{XOUT} is calculated as:

$$C_{XIN} = C_{XOUT} = (2 \times 16) - 2 = 30 \text{ pF.}$$

If using a driven reference clock, set C_{XIN} and C_{XOUT} to the minimum value 12 pF, connect the reference to XIN/CLKIN, and leave XOUT unconnected.

Output Frequency (SSCLK1 through SSCLK6 Outputs)

All the SSCLK outputs are produced by synthesizing the input reference frequency using a PLL and modulating the VCO frequency. SSCLK[1:4] are fixed function output clocks (SSCLK). SSCLK5 and SSCLK6 are also programmable to function the same as SSCLK[1:4], or as buffered copies of the input reference (REFOUT), or as control pin as discussed in [Control Pins \(CP0, CP1, CP2 and CP3\)](#). To use the 2.5 V output drive option on SSCLK[1:4], VDDL must be connected to a 2.5 V power supply (SSCLK[1:4] outputs are powered by VDDL). When using the 2.5 V output drive option, the maximum output frequency on SSCLK[1:4] is 166 MHz.

Spread Percentage (SSCLK1 to SSCLK6 Outputs)

The SSCLK frequency is programmed to a percentage value from $\pm 0.25\%$ to $\pm 2.5\%$ for center spread and from -0.5% to -5.0% down spread. The granularity is 0.25%.

Modulation Frequency

The default modulation frequency is 31.5 kHz. Other modulation frequencies available via the configuration software are 30.1 kHz and 32.9 kHz.

Table 4. Using Clock Select, CLKSEL Control Pin

Input Frequency (MHz)	CLKSEL (Pin 4)	SSCLK1 (Pin 7)	SSCLK2 (Pin 8)	SSCLK3 (Pin 9)	SSCLK4 (Pin 12)	REFOUT (Pin 14)	REFOUT (Pin 15)
14.318	CLKSEL = 0	33.33	33.33	33.33	33.33	14.318	14.318
	CLKSEL = 1	66.66	66.66	66.66	66.66	14.318	14.318

*B	267832	RGL	See ECN	Added Field Programmable Devices and Functionality
*C	291094	RGL	See ECN	Added t _{SKEW} spec. and footnote
*D	1821908	DPF/AESA	See ECN	Corrected FSSCLK-Low Voltage specification on page 7 for SSCLK5/6 to SSCLK1/2/3/4, as SSCLK5/6 output does not operate at low voltage. Deleted Tccj4 on page 8 for the same reason as above
*E	2442066	KVM/AESA	See ECN	Updated template. Added Note "Not recommended for new designs." Added part number CY25200KZXC_XXXW, CY25200KZXC_XXXWT, CY25200KFZXC in ordering information table. Changed package name to ZZ16.
*F	2758387	KVM/AESA	09/01/2009	Extensive text edits Replaced Benefits column on page 1 with Description Revised Table 2 and Table 3 for clarity Revised the Modulation Frequency paragraph to align with actual software options and to delete mention of custom frequencies Corrected 3.3V I _{OL} and I _{OH} values, Filled in missing units in AC Electrical table Revised T _{SKEW} footnote for clarity Removed specific PD# and OE pin nos. from parameters T _{STP} , T _{OE1} and T _{OE2} Standardized timing parameter names to upper case Corrected part numbers in Ordering Information Table Removed part number CY25200FZXCT Added part number CY25200KFZXCT Replaced CY3672 and CY3672-PRG with CY3672-USB
*G	2897246	KVM	03/22/10	Removed inactive parts from Ordering Information table. Added note regarding possible configurations in Ordering Information section. Removed Note 6. Added Possible Configurations table. Updated Package Drawing and Dimensions .
*H	3103982	BASH	07/12/2010	Added Ordering Code Definitions . Updated Package Drawing and Dimensions . Added Acronyms and Units of Measure . Minor edits and updated in new template.

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at www.cypress.com/sales.

Products

Automotive	cypress.com/go/automotive
Clocks & Buffers	cypress.com/go/clocks
Interface	cypress.com/go/interface
Lighting & Power Control	cypress.com/go/powerpsoc
	cypress.com/go/plc
Memory	cypress.com/go/memory
Optical & Image Sensing	cypress.com/go/image
PSoC	cypress.com/go/psoc
Touch Sensing	cypress.com/go/touch
USB Controllers	cypress.com/go/USB
