Functional Description

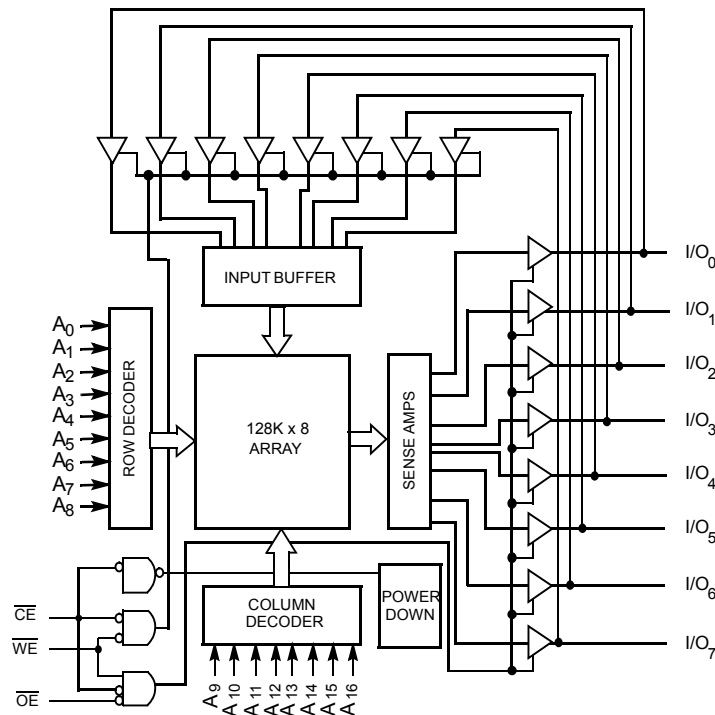

The CY7C1019CV33 is a high performance CMOS static RAM organized as 131,072 words by 8 bits. Easy memory expansion is provided by an active LOW Chip Enable (\overline{CE}), an active LOW Output Enable (\overline{OE}), and tristate drivers. This device has an automatic power down feature that significantly reduces power consumption when deselected.

Writing to the device is accomplished by taking Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{16}).

Reading from the device is accomplished by taking Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW while forcing Write Enable (\overline{WE}) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input/output pins (I/O_0 through I/O_7) are placed in a high impedance state when the device is deselected (\overline{CE} HIGH), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE} LOW, and \overline{WE} LOW).

t_{HZWE}	\overline{WE} LOW to High Z ^[6, 7]	–	5	ns

Notes

- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V.
- t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with a load capacitance of 5 pF as in part (d) of Figure 2 on page 5. Transition is measured ± 500 mV from steady-state voltage.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
- This parameter is guaranteed by design and is not tested.
- The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. \overline{CE} and \overline{WE} must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data setup and hold timing should be referenced to the leading edge of the signal that terminates the write.
- The minimum write cycle time for Write Cycle no. 3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .

Figure 4. Read Cycle No. 2 (\overline{OE} Controlled) [12, 13]

Figure 5. Write Cycle No. 1 (\overline{CE} Controlled) [14, 15]

Notes

- 11. Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$.
- 12. WE is HIGH for read cycle.
- 13. Address valid prior to or coincident with \overline{CE} transition LOW.
- 14. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
- 15. If CE goes HIGH simultaneously with WE going HIGH, the output remains in a high impedance state.

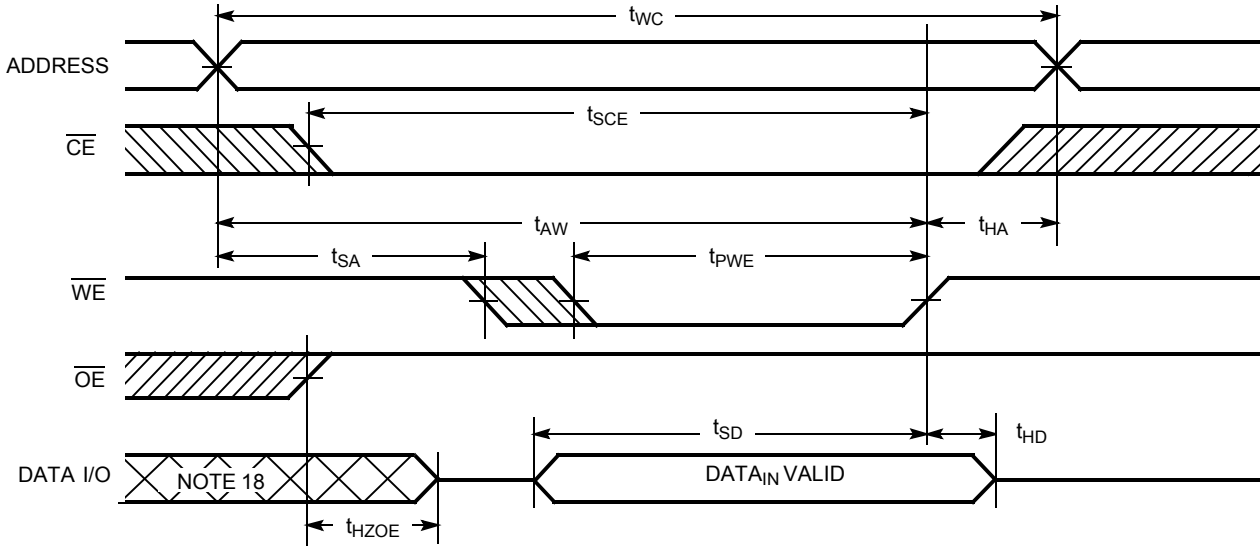

Figure 7. Write Cycle No. 3 (\overline{WE} Controlled, \overline{OE} LOW) [17]

Notes

- 16. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
- 17. If \overline{CE} goes HIGH simultaneously with \overline{WE} going HIGH, the output remains in a high impedance state.
- 18. During this period the I/Os are in the output state and input signals should not be applied.
