

**4-Mbit (256 K × 18)
Pipelined DCD Sync SRAM**

Features

- Registered inputs and outputs for pipelined operation
- Optimal for performance (double-cycle deselect)
 - Depth expansion without wait state
- 256 K × 18 common I/O architecture
- 3.3 V core power supply (V_{DD})
- 3.3 V/2.5 V I/O power supply (V_{DDQ})
- Fast clock-to-output times
 - 4.0 ns (for 133-MHz device)
- Provide high-performance 3-1-1-1 access rate
- User-selectable burst counter supporting Intel® Pentium® interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self-timed writes
- Asynchronous output enable
- Available in Pb-free 100-pin TQFP package
- “ZZ” sleep mode option

Functional Description

The CY7C1328G SRAM integrates 256 K × 18 SRAM cells with advanced synchronous peripheral circuitry and a two-bit counter for internal burst operation. All synchronous inputs are gated by registers controlled by a positive-edge-triggered clock input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining chip enable (\overline{CE}_1), depth-expansion chip enables (\overline{CE}_2 and \overline{CE}_3), burst control inputs (ADSC, ADSP, and ADV), write enables ($BW_{[A:B]}$, and BWE), and global write (GW). Asynchronous inputs include the output enable (\overline{OE}) and the ZZ pin.

Addresses and chip enables are registered at rising edge of clock when either address strobe processor (ADSP) or address strobe controller (ADSC) are active. Subsequent burst addresses can be internally generated as controlled by the advance pin (ADV).

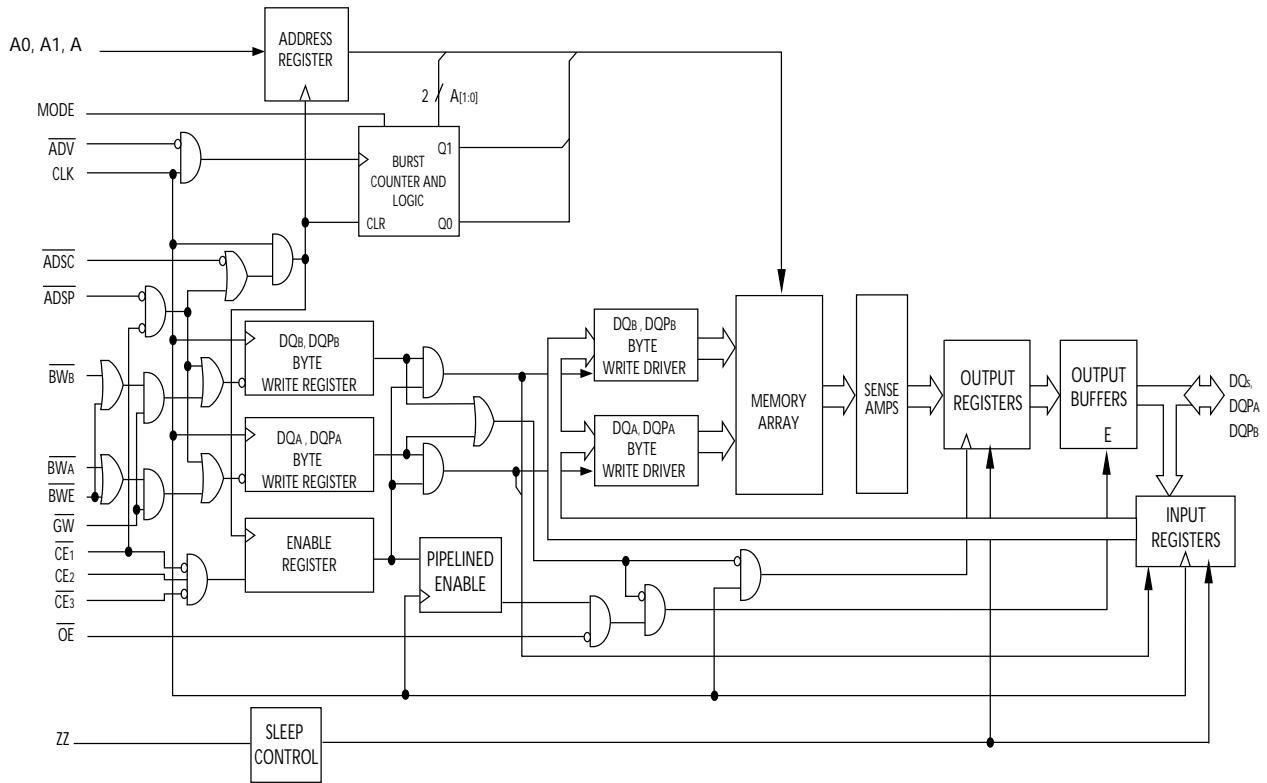

Address, data inputs, and write controls are registered on-chip to initiate a self-timed write cycle. This part supports byte write operations (see [Pin Definitions on page 5](#) and [Truth Table on page 8](#) for further details). Write cycles can be one to two bytes wide as controlled by the byte write control inputs. GW active LOW causes all bytes to be written. This device incorporates an additional pipelined enable register which delays turning off the output buffers an additional cycle when a deselect is executed. This feature allows depth expansion without penalizing system performance.

The CY7C1328G operates from a +3.3 V core power supply while all outputs operate with a +3.3 V or a +2.5 V supply. All inputs and outputs are JEDEC-standard JESD8-5-compatible.

Pin Configurations

Figure 1. 100-pin TQFP (14 × 20 × 1.4 mm) pinout

Pin Definitions

Pin	TQFP	Type	Description
A ₀ , A ₁ , A	37, 36, 32, 33, 34, 35, 44, 45, 46, 47, 48, 49, 50, 80, 81, 82, 99, 100	Input-synchronous	Address inputs used to select one of the 256 K address locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and CE ₁ , CE ₂ , and CE ₃ are sampled active. A _[1:0] are fed to the two-bit counter.
BW _A , BW _B	93,94	Input-synchronous	Byte write select inputs, active LOW. Qualified with BWE to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.
GW	88	Input-synchronous	Global write enable input, active LOW. When asserted LOW on the rising edge of CLK, a global write is conducted (all bytes are written, regardless of the values on BW _[A:B] and BWE).
BWE	87	Input-synchronous	Byte write enable input, active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
CLK	89	Input-clock	Clock input. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation.
CE ₁	98	Input-synchronous	Chip enable 1 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₂ and CE ₃ to select/deselect the device. ADSP is ignored if CE ₁ is HIGH. CE ₁ is sampled only when a new external address is loaded.
CE ₂	97	Input-synchronous	Chip enable 2 input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₃ to select/deselect the device. CE ₂ is sampled only when a new external address is loaded.
CE ₃	92	Input-synchronous	Chip enable 3 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₂ to select/deselect the device. CE ₃ is sampled only when a new external address is loaded.
OE	86	Input-asynchronous	Output enable, asynchronous input, active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, DQ pins are tri-stated, and act as input data pins. OE is masked during the first clock of a read cycle when emerging from a deselected state.
ADV	83	Input-synchronous	Advance input signal, sampled on the rising edge of CLK, active LOW. When asserted, it automatically increments the address in a burst cycle.
ADSP	84	Input-synchronous	Address strobe from processor, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A _[1:0] are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. ADSP is ignored when CE ₁ is deasserted HIGH.
ADSC	85	Input-synchronous	Address strobe from controller, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A _[1:0] are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized.
ZZ	64	Input-asynchronous	ZZ “sleep” input, active HIGH. When asserted HIGH places the device in a non-time-critical “sleep” condition with data integrity preserved. During normal operation, this pin has to be low or left floating. ZZ pin has an internal pull-down.
DQs, DQP _[A:B]	58, 59, 62, 63, 68, 69, 72, 73, 74, 8, 9, 12, 13, 18, 19, 22, 23, 24	I/O-synchronous	Bidirectional data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQs and DQP _[A:B] are placed in a tristate condition.
V _{DD}	15, 41, 65, 91	Power supply	Power supply inputs to the core of the device.
V _{SS}	17, 40, 67, 90	Ground	Ground for the core of the device.
V _{DDQ}	4, 11, 20, 27, 54, 61, 70, 77	I/O power supply	Power supply for the I/O circuitry.
V _{SSQ}	5, 10, 21, 26, 55, 60, 71, 76	I/O ground	Ground for the I/O circuitry.

Pin Definitions (continued)

Pin	TQFP	Type	Description
MODE	31	Input-static	Selects burst order. When tied to GND selects linear burst sequence. When tied to V _{DD} or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. Mode pin has an internal pull-up.
NC	1, 2, 3, 6, 7, 14, 16, 25, 28, 29, 30, 38, 39, 42, 43, 51, 52, 53, 56, 57, 66, 75, 78, 79, 95, 96	–	No connects. Not internally connected to the die.

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock.

The CY7C1328G supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486™ processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the processor address strobe (ADSP) or the controller address strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the byte write enable (BWE) and byte write select (BW_[A:B]) inputs. A global write enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Synchronous chip selects CE₁, CE₂, CE₃ and an asynchronous output enable (OE) provide for easy bank selection and output tristate control. ADSP is ignored if CE₁ is HIGH.

Single Read Accesses

This access is initiated when the following conditions are satisfied at clock rise: (1) ADSP or ADSC is asserted LOW, (2) chip selects are all asserted active, and (3) the write signals (GW, BWE) are all deasserted HIGH. ADSP is ignored if CE₁ is HIGH. The address presented to the address inputs is stored into the address advancement logic and the address register while being presented to the memory core. The corresponding data is allowed to propagate to the input of the output registers. At the rising edge of the next clock the data is allowed to propagate through the output register and onto the data bus within t_{CO} if OE is active LOW. The only exception occurs when the SRAM is emerging from a deselected state to a selected state, its outputs are always tri-stated during the first cycle of the access. After the first cycle of the access, the outputs are controlled by the OE signal. Consecutive single read cycles are supported.

The CY7C1328G is a double-cycle deselect part. Once the SRAM is deselected at clock rise by the chip select and either ADSP or ADSC signals, its output will tristate immediately after the next clock rise.

Single Write Accesses Initiated by ADSP

This access is initiated when both of the following conditions are satisfied at clock rise: (1) ADSP is asserted LOW, and (2) chip select is asserted active. The address presented is loaded into the address register and the address advancement logic while being delivered to the memory core. The write signals (GW, BWE, and BW_[A:B]) and ADV inputs are ignored during this first cycle.

ADSP triggered write accesses require two clock cycles to complete. If GW is asserted LOW on the second clock rise, the data presented to the DQx inputs is written into the corresponding address location in the memory core. If GW is HIGH, then the write operation is controlled by BWE and BW_[A:B] signals. The CY7C1328G provides byte write capability that is described in the Write Cycle Description table. Asserting the byte write enable input (BWE) with the selected byte write input will selectively write to only the desired bytes. Bytes not selected during a byte write operation will remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

Because the CY7C1328G is a common I/O device, the output enable (OE) must be deasserted HIGH before presenting data to the DQ inputs. Doing so will tristate the output drivers. As a safety precaution, DQ are automatically tri-stated whenever a write cycle is detected, regardless of the state of OE.

Single Write Accesses Initiated by ADSC

ADSC write accesses are initiated when the following conditions are satisfied: (1) ADSC is asserted LOW, (2) ADSP is deasserted HIGH, (3) chip select is asserted active, and (4) the appropriate combination of the write inputs (GW, BWE, and BW_[A:B]) are asserted active to conduct a write to the desired byte(s). ADSC triggered write accesses require a single clock cycle to complete. The address presented is loaded into the address register and the address advancement logic while being delivered to the memory core. The ADV input is ignored during this cycle. If a global write is conducted, the data presented to the DQx is written into the corresponding address location in the memory core. If a byte write is conducted, only the selected bytes are written. Bytes not selected during a byte write operation will remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

Because the CY7C1328G is a common I/O device, the output enable (OE) must be deasserted HIGH before presenting data to the DQx inputs. Doing so will tristate the output drivers. As a

safety precaution, DQ_x are automatically tri-stated whenever a write cycle is detected, regardless of the state of OE.

Burst Sequences

The CY7C1328G provides a two-bit wraparound counter, fed by $A_{[1:0]}$, that implements either an interleaved or linear burst sequence. The interleaved burst sequence is designed specifically to support Intel Pentium applications. The linear burst sequence is designed to support processors that follow a linear burst sequence. The burst sequence is user selectable through the MODE input. Both read and write burst operations are supported.

Asserting \overline{ADV} LOW at clock rise will automatically increment the burst counter to the next address in the burst sequence. Both read and write burst operations are supported.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation “sleep” mode. Two clock cycles are required to enter into or exit from this “sleep” mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the “sleep” mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the “sleep” mode. \overline{CEs} , ADSP, and ADSC must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

ZZ Mode Electrical Characteristics

Parameter	Description	Test Conditions	Min	Max	Unit
I_{DDZZ}	Snooze mode standby current	$ZZ \geq V_{DD} - 0.2 V$	–	40	mA
t_{ZZS}	Device operation to ZZ	$ZZ \geq V_{DD} - 0.2 V$	–	$2t_{CYC}$	ns
t_{ZZREC}	ZZ recovery time	$ZZ \leq 0.2 V$	$2t_{CYC}$	–	ns
t_{ZZI}	ZZ active to snooze current	This parameter is sampled	–	$2t_{CYC}$	ns
t_{RZZI}	ZZ inactive to exit snooze current	This parameter is sampled	0	–	ns

Notes

- X = "Don't Care." H = Logic HIGH, L = Logic LOW.
- \overline{WRITE} = L when any one or more byte write enable signals ($\overline{BW_A}$, $\overline{BW_B}$) and $\overline{BWE} = L$ or $\overline{GW} = L$. $\overline{WRITE} = H$ when all byte write enable signals ($\overline{BW_A}$, $\overline{BW_B}$), \overline{BWE} , $\overline{GW} = H$.
- The DQ pins are controlled by the current cycle and the \overline{OE} signal. \overline{OE} is asynchronous and is not sampled with the clock.
- The \overline{SRAM} always initiates a read cycle when ADSP is asserted, regardless of the state of \overline{GW} , \overline{BWE} , or $\overline{BW_X}$. Writes may occur only on subsequent clocks after the ADSP or with the assertion of ADSC. As a result, \overline{OE} must be driven HIGH prior to the start of the write cycle to allow the outputs to tristate. \overline{OE} is a don't care for the remainder of the write cycle.
- \overline{OE} is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tristate when \overline{OE} is inactive or when the device is deselected, and all data bits behave as output when \overline{OE} is active (LOW).

Truth Table for Read/Write

The Truth Table for read or write for part CY7C1328G is as follows. ^[6]

Function	\overline{GW}	\overline{BWE}	\overline{BW}_A	\overline{BW}_B
Read	H	H	X	X
Read	H	L	H	H
Write byte A – (DQ _A and DQP _A)	H	L	L	H
Write byte B – (DQ _B and DQP _B)	H	L	H	L
Write all bytes	H	L	L	L
Write all bytes	L	X	X	X

Note

6. X = "Don't Care." H = Logic HIGH, L = Logic LOW.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage temperature -65 °C to +150 °C
 Ambient temperature with power applied -55 °C to +125 °C
 Supply voltage on V_{DD} relative to GND -0.5 V to +4.6 V
 Supply voltage on V_{DDQ} relative to GND -0.5 V to +V_{DD}
 DC voltage applied to outputs in tristate -0.5 V to V_{DDQ} + 0.5 V

DC input voltage -0.5 V to V_{DD} + 0.5 V
 Current into outputs (LOW) 20 mA
 Static discharge voltage (per MIL-STD-883, method 3015) > 2001 V
 Latch up current > 200 mA

Notes

10. Timing reference level is 1.5 V when V_{DDQ} = 3.3 V and is 1.25 V when V_{DDQ} = 2.5 V.
11. Test conditions shown in (a) of [Figure 2 on page 11](#) unless otherwise noted.
12. This part has a voltage regulator internally; t_{POWER} is the time that the power needs to be supplied above V_{DD(minimum)} initially before a read or write operation can be initiated.
13. t_{CHZ}, t_{CLZ}, t_{OELZ}, and t_{OEHZ} are specified with AC test conditions shown in part (b) of [Figure 2 on page 11](#). Transition is measured ±200 mV from steady-state voltage.
14. At any given voltage and temperature, t_{OEHZ} is less than t_{OELZ} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system conditions.
15. This parameter is sampled and not 100% tested.

Switching Waveforms

Figure 3. Read Timing [16]

Note

16. On this diagram, when \overline{CE} is LOW: \overline{CE}_1 is LOW, CE_2 is HIGH and \overline{CE}_3 is LOW. When \overline{CE} is HIGH: \overline{CE}_1 is HIGH or CE_2 is LOW or \overline{CE}_3 is HIGH.

Switching Waveforms (continued)

Figure 4. Write Timing [17, 18]

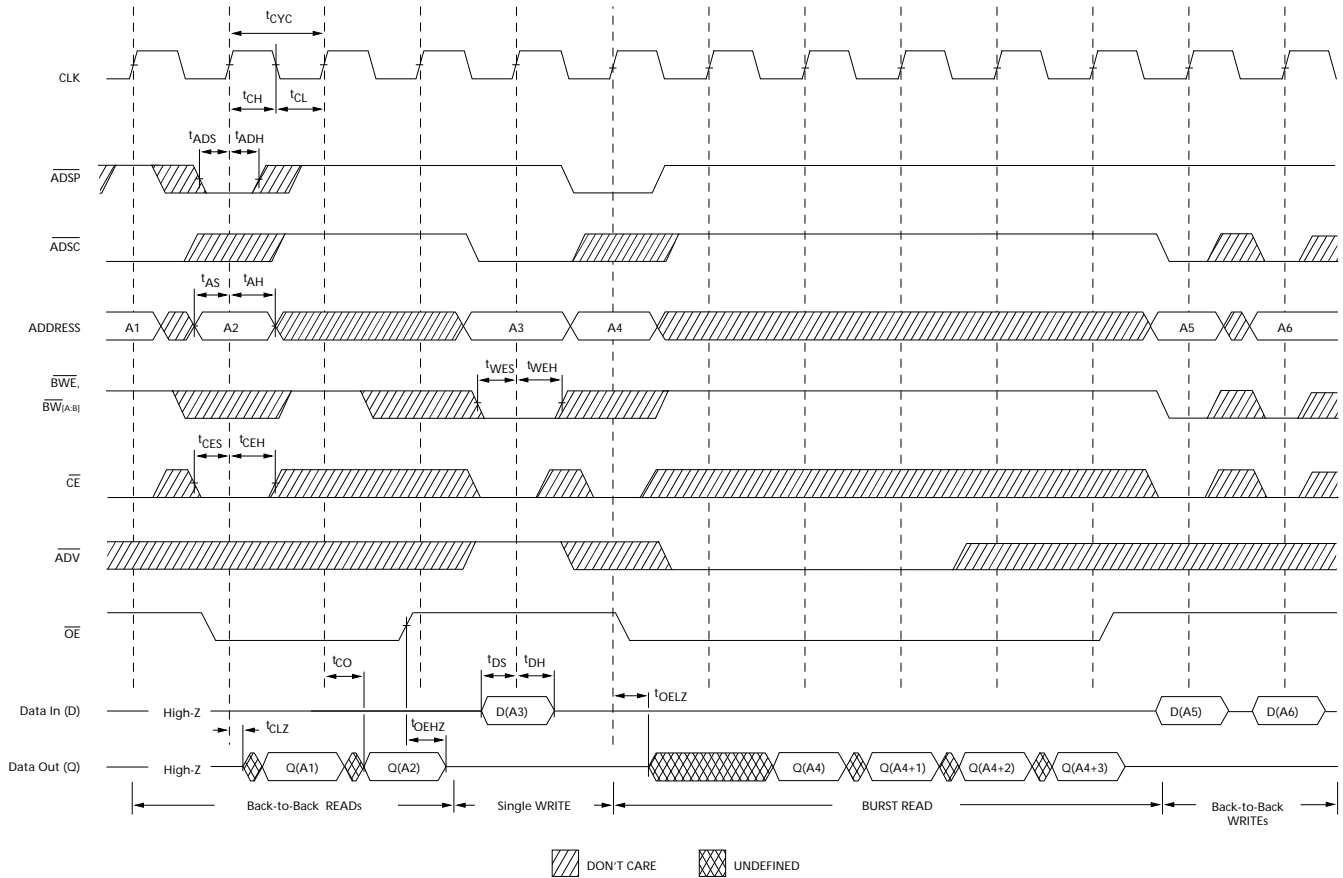

Notes

- 17. On this diagram, when \overline{CE} is LOW: \overline{CE}_1 is LOW, \overline{CE}_2 is HIGH and \overline{CE}_3 is LOW. When \overline{CE} is HIGH: \overline{CE}_1 is HIGH or \overline{CE}_2 is LOW or \overline{CE}_3 is HIGH.
- 18. Full width write can be initiated by either \overline{GW} LOW; or by \overline{GW} HIGH, \overline{BWE} LOW and $\overline{BW}_{[A:B]}$ LOW.

Switching Waveforms (continued)

Figure 5. Read/Write Timing [19, 20, 21]

Notes

- 19. On this diagram, when \overline{CE} is LOW: \overline{CE}_1 is LOW, CE_2 is HIGH and \overline{CE}_3 is LOW. When \overline{CE} is HIGH: \overline{CE}_1 is HIGH or CE_2 is LOW or \overline{CE}_3 is HIGH.
- 20. The data bus (Q) remains in high Z following a WRITE cycle, unless a new read access is initiated by ADSP or ADSC.
- 21. GW is HIGH.

Switching Waveforms (continued)

Figure 6. ZZ Mode Timing [22, 23]

Notes

- 22. Device must be deselected when entering ZZ mode. See truth table for all possible signal conditions to deselect the device.
- 23. DQs are in high Z when exiting ZZ sleep mode.

Ordering Information

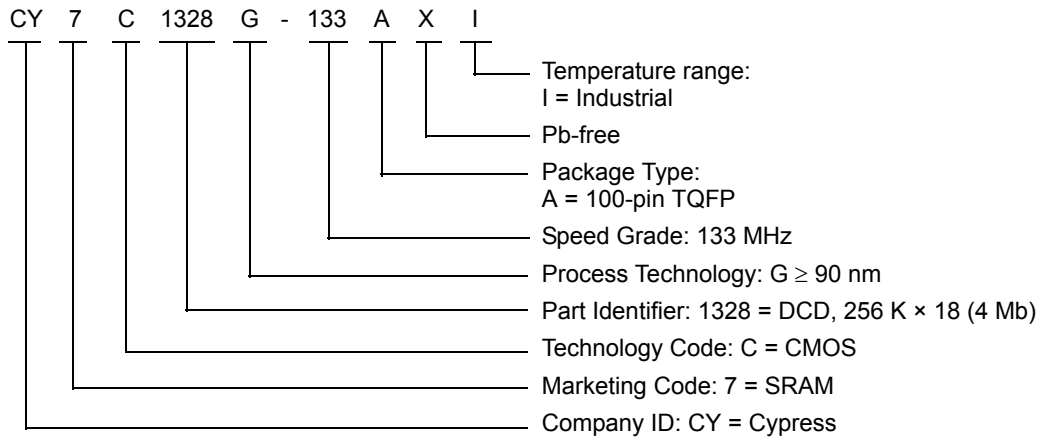

Cypress offers other versions of this type of product in many different configurations and features. The following table contains only the list of parts that are currently available.

For a complete listing of all options, visit the Cypress website at www.cypress.com and refer to the product summary page at <http://www.cypress.com/products> or contact your local sales representative.

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at <http://www.cypress.com/go/datasheet/offices>.

Speed (MHz)	Ordering Code	Package Diagram	Package Type	Operating Range
133	CY7C1328G-133AXI	51-85050	100-pin TQFP (14 × 20 × 1.4 mm) Pb-free	Industrial

Ordering Code Definitions

51-85050 *D

Acronyms

Acronym	Description
\overline{CE}	chip enable
CMOS	complementary metal oxide semiconductor
EIA	electronic industries alliance
I/O	input/output
JEDEC	joint electron devices engineering council
\overline{OE}	output enable
SRAM	static random access memory
TQFP	thin quad flat pack
TTL	transistor-transistor logic

Document Conventions

Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
MHz	megahertz
μA	microampere
mA	milliampere
mm	millimeter
ms	millisecond
mV	millivolt
nm	nanometer
ns	nanosecond
Ω	ohm
%	percent
pF	picofarad
V	volt
W	watt

Document History Page

Document Title: CY7C1328G, 4-Mbit (256 K × 18) Pipelined DCD Sync SRAM Document Number: 38-05523				
Rev.	ECN No.	Issue Date	Orig. of Change	Description of Change
**	224371	See ECN	RKF	New data sheet.
*A	288909	See ECN	VBL	Updated Ordering Information (Changed TQFP package to Pb-free TQFP package).
*B	333625	See ECN	SYT	Updated Pin Configurations (Modified Address Expansion balls in the pinouts for 100-pin TQFP Package as per JEDEC standards). Updated Pin Definitions . Updated Electrical Characteristics (Updated test conditions for V_{OL} and V_{OH} parameters). Updated Thermal Resistance (Replaced TBD's for Θ_{JA} and Θ_{JC} to their respective values). Updated Ordering Information (By shading and unshading MPNs as per availability).
*C	419264	See ECN	R XU	Changed status from Preliminary to Final. Changed address of Cypress Semiconductor Corporation from "3901 North First Street" to "198 Champion Court". Updated Features (Removed 133 MHz frequency related information, replaced 166 MHz with 167 MHz). Updated Selection Guide (Removed 133 MHz frequency related information, replaced 166 MHz with 167 MHz). Updated Electrical Characteristics (Updated Note 8 (Changed test condition from $V_{IH} \leq V_{DD}$ to $V_{IH} < V_{DD}$), changed the test condition for V_{OL} parameter from $V_{DD} = \text{Min.}$ to $V_{DD} = \text{Max.}$, changed "Input Load Current except ZZ and MODE" to "Input Leakage Current except ZZ and MODE", removed 133 MHz frequency related information, replaced 166 MHz with 167 MHz). Updated Switching Characteristics (Removed 133 MHz frequency related information, replaced 166 MHz with 167 MHz). Updated Ordering Information (Updated part numbers, replaced Package Name column with Package Diagram in the Ordering Information table). Updated Package Diagram .
*D	430373	See ECN	NXR	Updated Features (Included 133 MHz frequency related information). Updated Selection Guide (Included 133 MHz frequency related information). Updated Electrical Characteristics (Included 133 MHz frequency related information). Updated Switching Characteristics (Included 133 MHz frequency related information). Updated Ordering Information (Updated part numbers).
*E	480368	See ECN	VKN	Updated Maximum Ratings (Added the Maximum Rating for Supply Voltage on V_{DDQ} Relative to GND). Updated Ordering Information (Updated part numbers).
*F	2896584	03/20/2010	NJY	Updated Ordering Information (Removed obsolete part numbers). Updated Package Diagram .
*G	3045943	10/03/2010	NJY	Added Ordering Code Definitions . Added Acronyms and Units of Measure . Minor edits and updated in new template.
*H	3353361	08/24/2011	PRIT	Updated Functional Description (Updated Note as "For best practices recommendations, refer to SRAM System Design Guidelines ." and referred the note in same place in this section). Updated Package Diagram .
