

12-Bit, Ultra-Low Glitch, Voltage Output DIGITAL-TO-ANALOG CONVERTER

FEATURES

- **Relative Accuracy (INL): $\pm 0.35\text{LSB}$**
- **Ultra-Low Glitch Energy: 0.1nV-s**
- **Low Power Operation: $100\mu\text{A}$ at 2.7V**
- **Power-On Reset to Zero Scale**
- **Power Supply: 2.7V to 5.5V Single Supply**
- **Power-Down: $0.05\mu\text{A}$ at 2.7V**
- **12-Bit Linearity and Monotonicity**
- **Rail-to-Rail Voltage Output**
- **Settling Time: $5\mu\text{s}$ (Max)**
- **SPI-Compatible Serial Interface with Schmitt-Trigger Input: Up to 50MHz**
- **Daisy-Chain Capability**
- **Asynchronous Hardware Clear to Zero Scale**
- **Specified Temperature Range:
 -40°C to $+105^{\circ}\text{C}$**
- **Small, $2 \times 3 \text{ mm}$, 12-Lead SON Package**

APPLICATIONS

- **Portable, Battery-Powered Instruments**
- **Digital Gain and Offset Adjustment**
- **Programmable Voltage and Current Sources**
- **Programmable Attenuators**
- **Industrial Process Control**

DESCRIPTION

The DAC7551 is a single-channel, voltage-output digital-to-analog converter (DAC) with exceptional linearity and monotonicity, and a proprietary architecture that minimizes glitch energy. The low-power DAC7551 operates from a single 2.7V to 5.5V supply. The DAC7551 output amplifiers can drive a $2\text{k}\Omega$, 200pF load rail-to-rail with $5\mu\text{s}$ settling time; the output range is set using an external voltage reference.

The 3-wire serial interface operates at clock rates up to 50MHz and is compatible with SPI™, QSPI™, Microwire™, and DSP interface standards. The parts incorporate a power-on-reset circuit to ensure that the DAC output powers up to 0V and remains there until a valid write cycle to the device takes place. The part contains a power-down feature that reduces the current consumption of the device to under $2\mu\text{A}$.

Small size and low-power operation make the DAC7551 ideally suited for battery-operated, portable applications. The power consumption is typically 0.5mW at 5V , 0.23mW at 3V , and reduces to $1\mu\text{W}$ in power-down mode.

The DAC7551 is available in a 12-lead SON package and is specified over -40°C to $+105^{\circ}\text{C}$.

FUNCTIONAL BLOCK DIAGRAM

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SPI, QSPI are trademarks of Motorola, Inc.

Microwire is a trademark of National Semiconductor Corp..

All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(3) IOV_{DD} operates down to 1.8V with slightly degraded timing, as long as $V_{\text{IH}} \geq 0.8 \text{IOV}_{\text{DD}}$ and $V_{\text{IL}} \leq 0.2 \text{IOV}_{\text{DD}}$.

(4) I_{DD} tested with digital input code = 0032.

PIN CONFIGURATION

Pin Descriptions

PIN		DESCRIPTION
NO.	NAME	
1	V _{DD}	Analog voltage supply input
2	V _{REFH}	Positive reference voltage input
3	V _{REFL}	Negative reference voltage input
4	V _{FB}	DAC amplifier sense input.
5	V _{OUT}	Analog output voltage from DAC
6	GND ⁽¹⁾	Ground.
7	$\overline{\text{CLR}}$	Asynchronous input to clear the DAC registers. When $\overline{\text{CLR}}$ is low, the DAC register is set to 000h and the output voltage to 0V.
8	$\overline{\text{SYNC}}$	Frame synchronization input. The falling edge of the $\overline{\text{SYNC}}$ pulse indicates the start of a serial data frame shifted out to the DAC7551.
9	SCLK	Serial clock input
10	SDIN	Serial data input
11	SDO	Serial data output
12	IOV _{DD}	I/O voltage supply input

(1) Thermal pad should be connected to GND.

SERIAL WRITE OPERATION

Figure 1. Serial Write Operation Timing Diagram

TIMING CHARACTERISTICS⁽¹⁾⁽²⁾

All specifications at -40°C to $+105^{\circ}\text{C}$, $V_{\text{DD}} = 2.7\text{V}$ to 5.5V , and $R_{\text{L}} = 2\text{k}\Omega$ to GND (unless otherwise noted).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNITS
$t_1^{(3)}$ SCLK cycle time	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	20			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	20			
t_2 SCLK HIGH time	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	6.5			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	6.5			
t_3 SCLK LOW time	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	6.5			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	6.5			
t_4 $\overline{\text{SYNC}}$ falling edge to SCLK falling edge setup time	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	4			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	4			
t_5 Data setup time	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	3			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	3			
t_6 Data hold time	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	3			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	3			
t_7 SCLK falling edge to $\overline{\text{SYNC}}$ rising edge	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	0	$t_1 - 10\text{ns}^{(4)}$		ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	0	$t_1 - 10\text{ns}^{(4)}$		
t_8 Minimum $\overline{\text{SYNC}}$ HIGH time	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	20			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	20			
t_9 SCLK falling edge to SDO valid	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	10			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	10			
t_{10} $\overline{\text{CLR}}$ pulse width low	$V_{\text{DD}} = 2.7\text{V}$ to 3.6V	10			ns
	$V_{\text{DD}} = 3.6\text{V}$ to 5.5V	10			

(1) All input signals are specified with $t_{\text{R}} = t_{\text{F}} = 1\text{ns}$ (10% to 90% of V_{DD}) and timed from a voltage level of $(V_{\text{IL}} + V_{\text{IH}})/2$.

(2) See Figure 1, Serial Write Operation timing diagram.

(3) Maximum SCLK frequency is 50MHz at $V_{\text{DD}} = 2.7\text{V}$ to 5.5V .

(4) SCLK falling edge to $\overline{\text{SYNC}}$ rising edge time should not exceed $(t_1 - 10\text{ns})$ in order to latch the correct data.

THEORY OF OPERATION

DIGITAL-TO-ANALOG CONVERTER

The architecture of the DAC7551 consists of a string DAC followed by an output buffer amplifier. Figure 26 shows a generalized block diagram of the DAC architecture.

Figure 26. Typical DAC Architecture

The input coding to the DAC7551 is unsigned binary, which gives the ideal output voltage as:

$$V_{OUT} = 2 \times V_{REFL} + (V_{REFH} - V_{REFL}) \times D/4096$$

Where D = decimal equivalent of the binary code that is loaded to the DAC register, which ranges from 0 to 4095.

RESISTOR STRING

The resistor string section is shown in Figure 27. It is simply a string of resistors, each of value R. The digital code loaded to the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier. The voltage is tapped off by closing one of the switches connecting the string to the amplifier. It is specified monotonic because it is a string of resistors.

Figure 27. Typical Resistor String

OUTPUT BUFFER AMPLIFIERS

The output buffer amplifier is capable of generating rail-to-rail voltages on its output, giving an output range of 0V to V_{DD} . It is capable of driving a load of $2k\Omega$ in parallel with up to $1000pF$ to GND. The source and sink capabilities of the output amplifier can be seen in the typical curves. The slew rate is $1.8V/\mu s$ with a half-scale settling time of $3\mu s$ with the output unloaded.

DAC External Reference Input

The DAC7551 contains V_{REFH} and V_{REFL} reference inputs, which are unbuffered. The V_{REFH} reference voltage can be as low as 0.25V, and as high as V_{DD} because there is no restriction of headroom and footroom from any reference amplifier.

It is recommended to use a buffered reference in the external circuit (for example, the [REF3140](#)). The input impedance is typically $100k\Omega$.

Amplifier Sense Input

The DAC7551 contains an amplifier feedback input pin, V_{FB} . For voltage output operation, V_{FB} must be externally connected to V_{OUT} . For better DC accuracy, this connection should be made at load points. The V_{FB} pin is also useful for a variety of applications, including digitally-controlled current sources. The feedback input pin is internally connected to the DAC amplifier negative input terminal through a $100k\Omega$ resistor. The amplifier negative input terminal internally connects to ground through another $100k\Omega$ resistor ([Figure 26](#)). These connections form a gain-of-two, noninverting, amplifier configuration. Overall gain remains one because the resistor string has a divide-by-two configuration. The resistance seen at the V_{FB} pin is approximately $200k\Omega$ to ground.

Power-On Reset

On power up, all registers are cleared and the DAC channel is updated with zero-scale voltage. The DAC output remains in this state until valid data are written. This setup is particularly useful in applications where it is important to know the state of the DAC output while the device is powering up. In

order to not turn on ESD protection devices, V_{DD} and IOV_{DD} should be applied before any other pin (such as V_{REFH}) is brought high. The power-up sequence of V_{DD} and IOV_{DD} is irrelevant. Therefore, IOV_{DD} can be brought up before V_{DD} , or vice-versa.

Power Down

The DAC7551 has a flexible power-down capability. During a power-down condition, the user has flexibility to select the output impedance of the DAC. During power-down operation, the DAC can have either $1k\Omega$, $100k\Omega$, or Hi-Z output impedance to ground.

Asynchronous Clear

The DAC7551 output is asynchronously set to zero-scale voltage immediately after the \overline{CLR} pin is brought low. The \overline{CLR} signal resets all internal registers and therefore behaves like the Power-On Reset. The DAC7551 updates at the first rising edge of the \overline{SYNC} signal that occurs after the \overline{CLR} pin is brought back to high.

IOVDD and Level Shifters

The DAC7551 can be used with different logic families that require a wide range of supply voltages. To enable this useful feature, the IOV_{DD} pin must be connected to the logic supply voltage of the system. All DAC7551 digital input and output pins are equipped with level-shifter circuits. Level shifters at the input pins ensure that external logic-high voltages are translated to the internal logic-high voltage, with no additional power dissipation. Similarly, the level shifter for the SDO pin translates the internal logic-high voltage (V_{DD}) to the external logic-high level (IOV_{DD}). For single-supply operation, the IOV_{DD} pin can be tied to the V_{DD} pin.

SERIAL INTERFACE

The DAC7551 is controlled over a versatile 3-wire serial interface, which operates at clock rates up to 50MHz and is compatible with SPI, QSPI, Microwire, and DSP interface standards.

16-Bit Word and Input Shift Register

The input shift register is 16 bits wide. DAC data are loaded into the device as a 16-bit word under the control of a serial clock input, SCLK, as shown in Figure 1, the Serial Write Operation timing diagram. The 16-bit word, illustrated in Table 1, consists of four control bits followed by 12 bits of DAC data. The data format is straight binary with all zeroes corresponding to 0V output and all ones corresponding to full-scale output ($V_{REF} - 1\text{LSB}$). Data are loaded MSB first (bit 15) where the first two bits (DB15 and DB14) are *don't care* bits. Bit 13 and bit 12 (DB13 and DB12) determine either normal mode operation or power-down mode (see Table 1).

The $\overline{\text{SYNC}}$ input is a level-triggered input that acts as a frame synchronization signal and chip enable. Data can only be transferred into the device while $\overline{\text{SYNC}}$ is low. To start the serial data transfer, $\overline{\text{SYNC}}$ should be taken low, observing the minimum $\overline{\text{SYNC}}$ to SCLK falling edge setup time, t_4 . After $\overline{\text{SYNC}}$ goes low, serial data is shifted into the device input shift register on the falling edges of SCLK for 16 clock pulses.

The SPI interface is enabled after $\overline{\text{SYNC}}$ becomes low and the data are continuously shifted into the shift register at each falling edge of SCLK. When $\overline{\text{SYNC}}$ is brought high, the last 16 bits stored in the shift register are latched into the DAC register, and the DAC updates.

Daisy-Chain Operation

Daisy-chain operation is used for updating serially-connected devices on the rising edge of $\overline{\text{SYNC}}$.

As long as $\overline{\text{SYNC}}$ is high, the SDO pin is in a high-impedance state. When $\overline{\text{SYNC}}$ is brought low the output of the internal shift register is tied to the SDO pin. As long as $\overline{\text{SYNC}}$ is low, SDO duplicates the SDIN signal with a 16-cycle delay. To support multiple devices in a daisy chain, SCLK and $\overline{\text{SYNC}}$ signals are shared across all devices, and SDO of one DAC7551 should be tied to the SDIN of the next DAC7551. For n devices in such a daisy chain, $16n$ SCLK cycles are required to shift the entire input data stream. After $16n$ SCLK falling edges are received, following a falling $\overline{\text{SYNC}}$, the data stream becomes complete and $\overline{\text{SYNC}}$ can be brought high to update n devices simultaneously. SDO operation is specified at a maximum SCLK speed of 10MHz.

In daisy-chain mode, the use of a weak pull-down resistor on the SDO output pin, which provides the SDIN data for the next device in the chain, is recommended. For standalone operation, the maximum clock speed is 50MHz. For daisy-chain operation, the maximum clock speed is 10MHz.

INTEGRAL AND DIFFERENTIAL LINEARITY

The DAC7551 uses precision thin-film resistors providing exceptional linearity and monotonicity. Integral linearity error is typically within $\pm 0.35\text{LSBs}$, and differential linearity error is typically within $\pm 0.08\text{LSBs}$.

GLITCH ENERGY

The DAC7551 uses a proprietary architecture that minimizes glitch energy. The code-to-code glitches are so low that they are usually buried within the wide-band noise and cannot be easily detected. The DAC7551 glitch is typically well under $0.1\text{nV}\cdot\text{s}$. Such low glitch energy provides more than a ten-time improvement over industry alternatives.

Table 1. Serial Interface Programming

CONTROL				DATA BITS	FUNCTION
DB15	DB14	DB13 (PD1)	DB12 (PD0)	DB11–DB0	
X	X	0	0	data	Normal mode
X	X	0	1	X	Powerdown $1\text{k}\Omega$
X	X	1	0	X	Powerdown $100\text{k}\Omega$
X	X	1	1	X	Powerdown Hi-Z

APPLICATION INFORMATION

WAVEFORM GENERATION

As a result of the exceptional linearity and low glitch of the DAC7551, the device is well-suited for waveform generation (from DC to 10kHz). The DAC7551 large-signal settling time is 5 μ s, supporting an update rate of 200kSPS. However, the update rates can exceed 1MSPS if the waveform to be generated consists of small voltage steps between consecutive DAC updates. To obtain a high dynamic range, REF3140 (4.096V) or REF02 (5.0V) are recommended for reference voltage generation.

GENERATING $\pm 5V$, $\pm 10V$, AND $\pm 12V$ OUTPUTS FOR PRECISION INDUSTRIAL CONTROL

Industrial control applications can require multiple feedback loops consisting of sensors, ADCs, MCUs, DACs, and actuators. Loop accuracy and loop speed are the two important parameters of such control loops.

Loop Accuracy

DAC offset, gain, and the integral linearity errors are not factors in determining the accuracy of the loop. As long as a voltage exists in the transfer curve of a monotonic DAC, the loop can find it and settle to it. On the other hand, DAC resolution and differential linearity do determine the loop accuracy, because each DAC step determines the minimum incremental change the loop can generate. A DNL error less than -1 LSB (non-monotonicity) can create loop instability. A DNL error greater than $+1$ LSB implies unnecessarily large voltage steps and missed voltage targets. With high DNL errors, the loop loses its stability, resolution, and accuracy. Offering 12-bit ensured monotonicity and ± 0.08 LSB typical DNL error, DAC755x devices are great choices for precision control loops.

Loop Speed

Many factors determine the control loop speed, such as ADC conversion time, MCU speed, and DAC settling time. Typically, the ADC conversion time, and the MCU computation time are the two major factors that dominate the time constant of the loop. DAC settling time is rarely a dominant factor because ADC conversion times usually exceed DAC conversion times. DAC offset, gain, and linearity errors can slow the loop down only during the start-up. Once the loop reaches its steady-state operation, these errors do not affect loop speed any further. Depending on the ringing characteristics of the loop transfer function, DAC glitches can also

slow the loop down. With its 1MSPS (small-signal) maximum data update rate, DAC7551 can support high-speed control loops. Ultralow glitch energy of the DAC7551 significantly improves loop stability and loop settling time.

GENERATING INDUSTRIAL VOLTAGE RANGES

For control loop applications, DAC gain and offset errors are not important parameters. This consideration could be exploited to lower trim and calibration costs in a high-voltage control circuit design. Using a quad operational amplifier (OPA4130), and a voltage reference (REF3140), the DAC7551 can generate the wide voltage swings required by the control loop.

Figure 28. Low-cost, Wide-swing Voltage Generator for Control Loop Applications

The output voltage of the configuration is given by:

$$V_{OUT} = V_{REF} \left(\frac{R2}{R1} + 1 \right) \frac{SDIN}{4096} - V_{tail} \left(\frac{R2}{R1} \right) \quad (1)$$

Fixed R1 and R2 resistors can be used to coarsely set the gain required in the first term of the equation. Once R2 and R1 set the gain to include some minimal over-range, a single DAC7551 could be used to set the required offset voltages. Residual errors are not an issue for loop accuracy because offset and gain errors could be tolerated. One DAC7551 can provide the V_{tail} voltages, while four additional DAC7551 devices can provide V_{dac} voltages to generate four high-voltage outputs. A single SPI interface is sufficient to control all five DAC7551 devices in a daisy-chain configuration.

For $\pm 5V$ operation:

$$R1 = 10k\Omega, R2 = 15k\Omega, V_{tail} = 3.33V, V_{REF} = 4.096V$$

For $\pm 10V$ operation:

$$R1 = 10k\Omega, R2 = 39k\Omega, V_{tail} = 2.56V, V_{REF} = 4.096V$$

For $\pm 12V$ operation:

$$R1 = 10k\Omega, R2 = 49k\Omega, V_{tail} = 2.45V, V_{REF} = 4.096V$$

DAC7551IDRNR	ACTIVE	USON	DRN	12	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 105	D51	Samples
DAC7551IDRNRG4	ACTIVE	USON	DRN	12	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 105	D51	Samples
DAC7551IDRNT	ACTIVE	USON	DRN	12	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 105	D51	Samples
DAC7551IDRNTG4	ACTIVE	USON	DRN	12	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 105	D51	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF DAC7551 :

- Automotive: [DAC7551-Q1](#)

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

PLASTIC SMALL OUTLINE

4205915/B 05/05

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. SON (Small Outline No-Lead) package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
 - E. Package complies to JEDEC MO-229.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

DRN (R-PUSON-N12)

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/Son PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
