DIGITAL 54/74 TTL SERIES

DESCRIPTION

The 5413 and 7413 dual Schmitt triggers consist of two identical Schmitt-trigger circuits in monolithic integrated circuit form. Logically, each circuit functions as a four-input NAND gate, but because of the Schmitt action, the gate has different input threshold levels for positive- and negative-going signals. The hysteresis, or backlash, which is the difference between the two threshold levels, is typically 800mV.

An important design feature is the built-in temperature compensation which ensures very high stability of the threshold levels and the hysteresis over a very wide temperature range. Typically, the hysteresis changes by 3% over the temperature range of -55°C to 125°C and the upper threshold changes by 1% over the same range. The 5413/7413 can be triggered from the slowest of input ramps and still give clean, jitter-free output signals. It can not be triggered from straight dc levels.

These circuits are fully compatible with most other TTL, DTL, or MSI circuits. The 5413 is characterized for operation over the full military temperature range of -55°C to 125°C ; the 7413 is characterized for operation from 0°C to 70°C .
