## APPLICATION NOTES

### Input circuit

The SL1610C, SL1611C and SL1612C are normally used with pins 5 and 6 connected together and with the input connected via a capacitor as shown in Fig 2.

The input impedance is negative between 30MHz and 100MHz (SL1610C, SL1611C only) and is shown in Fig 3. If the source is inductive it should be shunted by a 1k $\Omega$  resistor to prevent oscillation.

An alternative input circuit with improved noise figure is shown in Fig 4.

Fig 4 Alternative input circuit

### Output circuit

The output stage is an emitter follower and has a negative output impedance at certain frequencies as shown in Fig 5.

To prevent oscillation when the load is capacitive a 47 $\Omega$  resistor should be connected in series with the output.

## AGC

When pin 7 is open circuit or connected to a voltage less than 2V the voltage gain is normal. As the AGC voltage is increased there is a reduction in gain as shown in Fig 6. This reduction varies with temperature.

Typical applications

The circuit of Fig. 7 is a general purpose RF preamplifier. The voltage gain (from pin 5 to pin 3) is shown in Fig. 8. Fig. 9 is the IF section of a simple SSB transceiver. At 9MHz it has a gain of 100dB.
