Data amplifier and laser supply circuit for CD and read-only optical systems (HDALAS)

TZA1015

FEATURES

- Six input buffer amplifiers with low-pass filtering and virtually no offset
- Universal photodiode IC interface using internal conversion resistors
- RF data amplifier with wide bandwidth designed for data rates up to a maximum of 30x
- Programmable RF gain for CD-A/V, CD-R, CD-R/W and CD-ROM applications
- Programmable RF bandwidth for optimal playability
- Radial error signal for fast track counting
- Programmable RF/Fast Track Count (FTC) gain for optimal dynamic range
- Fully automatic laser control including stabilization and on/off switch plus a separate supply for power efficiency
- Automatic monitor diode polarity selection
- Adjustable laser bandwidth and laser switch-on current slope using external capacitor
- Protection circuit to prevent laser damage due to supply voltage dip
- Optimized interconnection between data amplifier and Philips' digital signal processor family (CD7, ACE and MACE)
- Wide supply voltage range
- Wide temperature range
- Low power consumption.

GENERAL DESCRIPTION

The TZA1015 is a data amplifier and laser supply circuit for 3-beam pick-up detectors found in a wide range of CD and read-only optical systems.

The device contains 6 transimpedance amplifiers to amplify and filter the focus and radial photo diode voltage input signals. The preamplifier forms a versatile, programmable interface from voltage output CD mechanisms to the Philips' digital signal processor family.

The dynamic range of this preamplifier/processor combination can be optimized for the LF servo and RF data paths. The servo channel gain is set by the ADC range of the processor. The RF data channel can be programmed in the TZA1015 preamplifier.

The programmable RF bandwidth allows this device to be used in CD-A/V applications or CD-R, CD-R/W and CD-ROM applications with a data rate up to a maximum of 30x. The RF and LF gain can be adapted for CD-A/V, CD-R and CD-ROM discs or CD-R/W discs by means of a gain switch. In addition to this gain switch the RF gain is programmable to guarantee optimal playability. In order to enable minimal access time the TZA1015 generates a Fast Track Count signal which enables the decoder (ACE or MACE) to count the number of tracks during a track jump.

The device can accommodate astigmatic, single Foucault and double Foucault detectors and can be used with all laser and N- or P-sub monitor diodes. The Automatic Laser Power Control (ALPC) circuit will maintain control over the laser diode current. With an on-chip reference voltage generator, a constant and stabilized output power is ensured independent of ageing. A separate power supply connection allows the internal power dissipation to be reduced by connecting a low voltage supply.

ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
$V_{DD(RF,LF)}$	supply voltage		-0.5	+5.5	V
$V_{I(n)}$	input voltage for all pins		-0.5	$V_{DD(RF,LF)} + 0.5$	V
I_{source}	source current				
	pin FTC		–	4	mA
	pin RFP		–	2	mA
	pin RFN		–	2	mA
T_{amb}	operating ambient temperature		-40	+100	°C
P_{max}	maximum power dissipation	note 1	–	700	mW

Note

1. Based on standard measurement for determining thermal resistance of the package. In accordance with MIL-STD 883C.

CHARACTERISTICS

$V_{DD(LF)} = V_{DD(RF)} = V_{DD(L)} = 5.0$ V; $T_{amb} = 25$ °C; PWRON = HIGH; GSE = LOW; GARF = open-circuit; RFBWS = HIGH; DC input voltages at pins V_{COM} , D1 to D4, S5 and S6 = $\frac{1}{2}V_{DD}$; output voltage at pins O1 to O6 = 0 V; $I_{DD(L)(d)} = 50$ mA; $C_{CFIL} = 1$ nF; unless otherwise specified. Diode input voltages all with respect to V_{COM} .

Data amplifier and laser supply circuit for CD and read-only optical systems (HDALAS)

TZA1015

Notes

1. The output current can be increased but does not match the default input range of the servo system.
2. Matching defined in % of FS output per channel pairs (O1 – O2), (O3 – O4), (S5 – S6), at 1/3 and 2/3 of full output scale.
3. $V_{o(RFP)} = V_{o(RF)}$; $V_{o(RFN)} = -V_{o(RF)}$.
4. Gain is defined as: $G_{RF} = 20 \times \log \left[\frac{V_{o(RFP)}}{V_{i(LF)}} \right] = 20 \times \log \left[\frac{V_{o(RFN)}}{V_{i(LF)}} \right]$
 All inputs assumed to be equal: $V_{i(LF)} = \frac{\sum V_{i(D)}}{4}$, where i = 1 to 4 and D means diode.
5. See Figs 3, 4 and 5.
6. Voltage is based on 2 PN junctions and is temperature dependent.
7. Gain is defined as: $G_{FTC} = 20 \times \log \left[\frac{V_{o(FTC)}}{(V_{i(S5)} - V_{i(S6)})} \right]$

APPLICATION INFORMATION

The circuits shown in Figs 6 and 7 are applications for the TZA1015 (HDALAS) with the SAA7370A (CD7) or the SAA7348 (ACE).

- (1) Pins RFBWS, GARF and GSE can be microprocessor controlled but can also be fixed or switched by any other means.
- (2) For recommended values per speed see Table 3.
- (3) The FTC output is available for optional processing.

Fig.6 Application diagram with SAA7370A (CD7).

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (order code 9398 652 90011).

Reflow soldering

Reflow soldering techniques are suitable for all SO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

Wave soldering

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
